

WACC Calculation Summary for BTB Task btb-19b3361c. This analysis computes the Weighted Average Cost of Capital (WACC) for BTB Task btb-19b3361c. The WACC is calculated as the weighted average of the cost of debt and the cost of equity, where the weights are the market value of debt and equity, respectively. The cost of debt is calculated as the risk-free rate plus a debt risk premium, and the cost of equity is calculated as the risk-free rate plus an equity risk premium. The equity risk premium is calculated as the unlevered beta multiplied by the market risk premium. The unlevered beta is calculated as the levered beta divided by (1 plus the debt-to-equity ratio multiplied by the tax rate). The market risk premium is calculated as the market return minus the risk-free rate. The market return is calculated as the risk-free rate plus the market risk premium. The risk-free rate is calculated as the yield on a 10-year Treasury note. The market risk premium is calculated as the difference between the market return and the risk-free rate. The market return is calculated as the risk-free rate plus the market risk premium. The risk-free rate is calculated as the yield on a 10-year Treasury note.
